Tinker theme for WordPress by [Preseto](#)

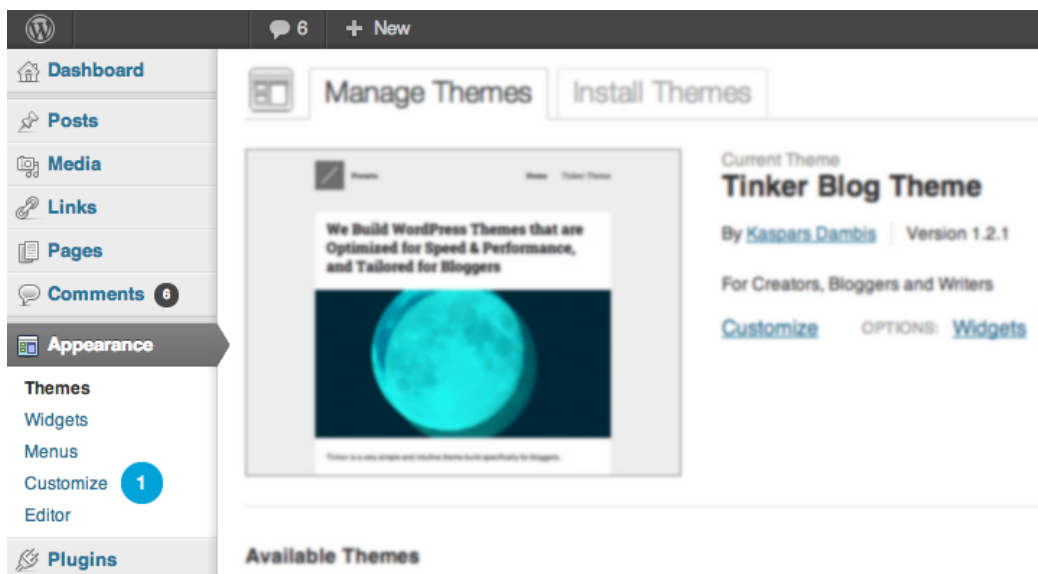

Installing Tinker

Go to **Appearance** → **Themes**, click on **Install Themes** tab and select the **Upload** sub-menu, and upload the **tinker-theme.zip** file that you downloaded from Themeforest.

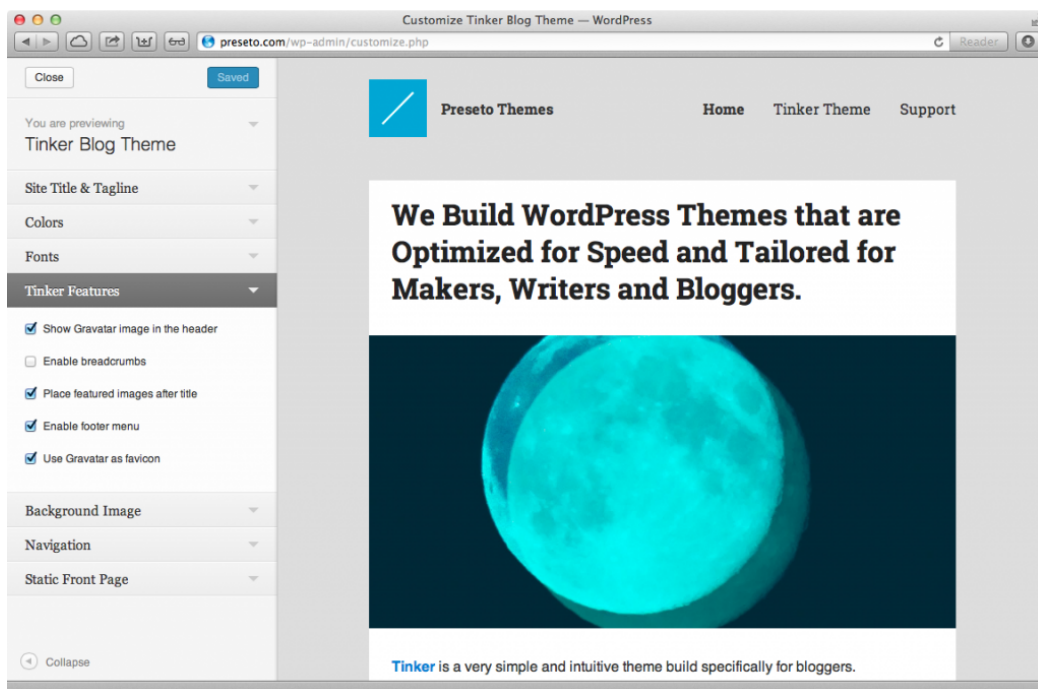

Customizing Tinker

Tinker uses the built-in theme customizer with instant preview which makes it very easy to change the look and feel of your site. Go to **Appearance** → **Customize** in WordPress admin menu and you'll see all the customization options displayed in the left menu:

which will open the built-in Theme Customizer. On the left hand side you'll see all available settings while on the right is a live preview of all the changes that you make.

Using the theme customizer you can change the following settings:

Modify site title and tagline. Note that site tagline is not shown on Tinker frontend but it's included in the source code for SEO purposes.

Set colors for background, links, header text and menu items, body text and headlines.

Enable or disable site-wide breadcrumb navigation which is used to illustrate the site structure and give an instant understand of visitors location on the site.

Enable or disable your profile picture from Gravatar in site header. Tinker will use the administrators email address (set under Settings → General in WordPress backend) for the Gravatar image, so make sure you have setup a photo for that email address on gravatar.com.

Automatically place featured images after the post title on blog archive pages and also when viewing individual posts and pages.

Enable footer menu area for a different set of menu links in the footer. Useful for linking to your social profiles on Twitter, Facebook, GitHub, Flickr, etc.

Use your profile photo from Gravatar as favicon. People who have bookmarked your blog will see your profile photo in their bookmark bar.

Place the contents of your custom posts page before the blog. Useful for describing the nature of your blog as well as adding a short bio.

Suggested Plugins

[Jetpack by WordPress.com](#) provides social sharing and publishing, analytics and other useful features.

[WordPress SEO by Yoast](#) adds XML sitemap, open graph meta data, twitter cards, Google authorship metadata and many more.
